

Technology Stack

Date	30 June 2026
Team ID	xxxxxx
Project Name	Credit Card Approval Prediction
Maximum Marks	2 Marks

Define Your Technology Stack:

The **Credit Card Approval Prediction** project uses **Python** as the programming language, **Flask** as the backend framework, and **HTML, CSS, and Bootstrap** for the frontend. A **CSV dataset** is used for data storage, while **Scikit-learn, Pandas, NumPy, and Joblib** are used for machine learning, data processing, and model loading. **GitHub** is used for version control, making the application efficient, maintainable, and easy to manage.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	HTML5, CSS3, Bootstrap	Used to create a responsive and user-friendly interface for entering applicant details and displaying the credit card approval prediction result.
2	Backend / Server-Side	Python, Flask	Flask handles user requests, processes input data, loads the trained machine learning model, and returns prediction results efficiently.

3	Database / Data Storage	CSV Dataset (clean_data.csv)	Stores the processed credit card application data used for training and testing the machine learning model.
4	Cloud / Hosting / Deployment	Flask Local Server	The application is deployed and tested on the local Flask development server for demonstration and project evaluation.
5	Version Control & CI/CD	GitHub	Used to manage source code, track project changes, and enable collaboration among all five team members.

6	Third-Party APIs / Other Tools	Joblib, Pandas, NumPy, Scikit- learn	Joblib loads the trained model and scaler, Pandas manages data processing, NumPy performs numerical operations, and Scikit-learn is used for model training and prediction.
